DIVISION: 06 00 00—WOOD, PLASTICS, AND COMPOSITES
Section: 06 05 73.13—Fire–Retardant Wood Treatment

REPORT HOLDER:
ARCH TREATMENT TECHNOLOGIES, INC.

EVALUATION SUBJECT:
DRICON® FIRE-RETARDANT-TREATED WOOD

ADDITIONAL LISTEES:
EXTERIOR WOOD, INC.
LEBEL CAMBIUM, INC.
MID-STATES WOOD PRESERVERS
SHAW/STEWART LUMBER COMPANY
STELLA-JONES, INC.

(ADDITIONAL MANUFACTURING LOCATION)
WARSAW VA & PETERBOROUGH ON

1.0 EVALUATION SCOPE
Compliance with the following codes:
- 2013 Abu Dhabi International Building Code (ADIBC)†

†The ADIBC is based on the 2009 IBC. 2009 IBC code sections referenced in this report are the same sections in the ADIBC.

Properties evaluated:
- Flame spread
- Structural
- Corrosion
- Hygroscopicity
- Fire-resistance-rated Wall Assemblies

2.0 USES
Dricon® fire-retardant-treated wood is used in areas that are not exposed to the weather or wetting, but may be exposed to dampness where the code permits the use of wood or fire-retardant-treated wood.

DESCRIPTION

2.1 General:
Dricon® fire-retardant-treated wood is lumber and plywood impregnated with Dricon® fire-retardant chemicals by a pressure process.

Dricon® treatment of lumber of the following species is recognized as being fire retardant:
- Douglas fir
- Spruce-pine-fir
- Redwood
- Spruce
- White pine
- Ponderosa pine
- Hem-fir
- Western red cedar
- Southern pine
- White fir
- Red pine
- Western hemlock

Dricon® treatment of plywood fabricated from Group 1 species with both face veneers of the following species is recognized as being fire retardant:
- Southern pine
- Douglas fir
- Spruce-pine-fir
- Lauan
- Redwood

2.2 Flame Spread:
Dricon® fire-retardant-treated wood has a flame-spread index of 25 or less when subjected to ASTM E84 tests of 30 minutes duration without evidence of significant progressive combustion.

2.3 Structural Strength and Durability:
2.3.1 General: The effects of the Dricon® fire-retardant treatment on the strength of the treated lumber and plywood must be accounted for in the design of the wood members and their connections. Load duration factors greater than 1.6 are not permitted to be used in the design.

2.3.2 Lumber: The strength properties of lumber when treated with Dricon® fire-retardant chemicals and used in applications at ambient temperatures up to 100°F (38°C), are subject to the design factors shown in Table 1 of this report. The strength properties of lumber, when treated with Dricon® fire-retardant chemicals and used in applications at elevated temperatures up to 150°F (66°C), are subject to the design factors shown in Table 2 of this report.

2.3.3 Plywood: The strength properties of plywood, when treated with Dricon® fire-retardant chemicals and used in applications at temperatures up to 170°F (77°C), are subject to the span and load limitations shown in Table 3 of this report.

2.4 Corrosion:
The corrosion rate of aluminum, carbon steel, galvanized steel, copper or red brass in contact with wood is not
increased by Dricon® fire-retardant treatment when the product is used as recommended by the manufacturer.

2.5 Hygroscopicity:

Dricon® treated wood qualifies as an Interior Type A (HT) fire-retardant wood in accordance with the American Wood Protection Association (AWPA) Standard U1, Commodity Specification H, Use Category UCFA. Dricon® treated Douglass fir, southern pine and spruce-pine-fir lumber, and Douglass fir, southern pine and spruce-pine-fir plywood, qualify as Interior Type A (HT) fire-retardant-treated wood when tested at 95 percent relative humidity.

3.0 DESIGN AND INSTALLATION

3.1 General:

Structural systems that include Dricon® fire-retardant-treated lumber or plywood must be designed and installed in accordance with the applicable code using the appropriate lumber design value adjustment factors and plywood spans from Tables 1, 2 and 3 of this report. Ventilation must be provided in accordance with the applicable codes.

The strength design factors and plywood spans noted in Tables 2 and 3 of this report are applicable under elevated temperatures resulting from cyclic climatic conditions. They are not applicable under continuous elevated temperatures resulting from manufacturing or other processes that require special consideration in design.

The treated lumber and plywood must only be used in areas (including attic spaces) where the lumber is exposed to temperatures of 150°F (66°C) or less and the plywood is exposed to temperatures of 170°F (77°C) or less.

Exposure to precipitation during storage or installation must be avoided. If material does become wet, it must be replaced or permitted to dry (maximum 19 percent moisture content for lumber and 15 percent moisture content for plywood) prior to covering or enclosure by wallboard or other construction materials (except for protection during construction).

3.2 Fasteners:

Fasteners used in Dricon® fire-retardant-treated wood must be galvanized steel, stainless steel, silicon bronze or copper, in accordance with Section 2304.10.5 of the 2018 and 2015 IBC, 2304.9.5 of the 2012, 2009 and 2006 IBC, Section 317.3 of the 2015, 2012, and 2009 IRC and Section 319.3 of the 2006 IRC, and must be subject to the design value adjustments indicated in Table 4 of this report.

3.3 Use as a Component in Fire-resistance-rated Wall Assemblies:

One-hour and Two-hour Exterior Wall Assembly Constructed in Accordance with Figure 2: In Type III, Type IV and Type V construction, the exterior wall assemblies must be constructed of Dricon® treated wood studs and plywood. The design values for the studs must be adjusted in accordance with Tables 1 and 2. The allowable spans for the plywood sheathing must be in accordance with the spans given in Table 3 for Dricon® Wall/Subfloor.

3.4 Plywood Shear Walls:

Wood-frame shear walls must be constructed in accordance with Section 2306.3 of the IBC (2306.4 of the 2009 and 2006 IBC).

When Dricon® fire-retardant-treated plywood is used in a shear wall, the thickness must be one standard size thicker than that determined in the tabulated allowable shear values contained in Section 4.3 of ANSI/AWC Special Design Provisions for Wind and Seismic (SDPWS) or as shown in the tables referenced in Section 2306.3 of the IBC (2306.4 of the 2009 and 2006 IBC). Thickness to be used for FRT plywood compared to untreated plywood shear walls are shown below:

4.0 CONDITIONS OF USE

The Dricon® fire-retardant-treated wood described in this report complies with, or is a suitable alternative to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

4.1 Strength calculations must be subject to the design factors or span ratings shown in Tables 1, 2 and 3 of this report.

4.2 The strength design factors and span ratings given in this report must only be used for unincised dimension lumber and plywood of the species noted in this report.

4.3 Dricon® treated wood must not be installed where it will be exposed to precipitation, direct wetting or regular condensation.

4.4 Dricon® treated wood must not be in contact with the ground.

4.5 Except as listed below, Dricon® lumber must not be ripped or milled as this will alter the surface-burning characteristics and invalidate the flame spread classification:

- Western red cedar lumber may be surfaced 1/2 inch (0.79 mm).
- Framing, end cuts, holes, joints such as tongue and groove, bevel, scarf and lap may be used.

4.6 Treatment is at the facilities of the listees noted in this report under a quality-control program with inspections by ICC-ES.

5.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Fire-retardant-treated Wood (AC66), dated June 2015 (Editorially revised April 2018).

6.0 IDENTIFICATION

6.1 Lumber and plywood treated with Dricon® fire-retardant chemicals must be identified by the structural grade mark of an approved agency. In addition, all treated lumber and plywood must be stamped with the listee company name and address; the production plant identification; labeling information in accordance with Section 2303.2.4 of the 2018, 2015, 2012 and 2009 IBC, Section 2303.2.1 of the 2006 IBC or Section 802.1.5.4 of the 2018 and 2015 IRC or Section R802.1.3.4 of the 2012 and 2009 IRC or Section R802.1.3.1 of the 2006 IRC; and the evaluation report number (ESR-1626). Refer to Figure 1.

Notes:
1 Total allowable loads and spans apply only to performance rated plywood for Structural 1, Exposure 1 or Exterior, unsanded and treated with Dricon® Fire Retardant according to AWPA standards.
2 Plywood glue lines shall be exterior glue and veneers shall be Group 1 species with both face veneers of the same species as noted in Section 3.1 of this report.
3 Panel edge support shall be required for roof sheathing. Panel edge clips when used shall be installed as follows: one midway between supports for 24-inch and 32-inch spans, two at 1/3-points between supports for 48-inch span.
4 The total allowable load (as shown above) is the sum of the live and dead loads. Dead loads should be subtracted from the above values to determine the live load. Dead loads typically range from 8-10 psf.
5 The loads shown are based on the most common one and two-span condition with strength axis perpendicular to supports. Other condition-load combinations exist and consult with Arch for the allowable loads for those combinations.
6 Deflection of roof sheathing tabulated at maximum live load is less than 1/286 of the span, and under maximum live load plus dead load is less than 1/180 of the span.
7 Sub floor applications are limited to 100 psf maximum live load.
8 Climate Zone definitions:
   1. Minimum design roof load or maximum ground snow load up to 20 psf
      a. Southwest Arizona, Southeast Nevada (Las Vegas-Yuma-Phoenix-Tucson triangle)
      b. All other qualifying areas of the continental United States
   2. Minimum ground snow load over 20 psf.
9 Arch Wood Protection, Inc. does not recommend 5/16 or 3/8 panel thicknesses for roofing applications.
10 19/32- and 5/8-inch-thick plywood shall be limited to performance rated 4 or 5 ply. 23/32- and ¾-inch-thick plywood shall be limited to performance rated 5 or 7 ply.

3 Labeling information in accordance with Section 2303.2.1 must be included on the lumber and plywood.
Fire Retardant Treated Wood Dricon® Lumber and Plywood
Fire Resistance Ratings – ASTM E119

Bearing Wall Rating – 1 Hour Rating from Exterior (See Items 6d (ii) and 6e)

Bearing Wall Rating – 2 Hour Rating Exposed to Fire from Interior Face

Loaded Per NDS 2012 NDS Supplement, ASD Method, Wall Braced at Mid-Height

(Load Adjusted for Strength Design Factors for Dricon® FRTW Lumber)

FIGURE 2—ONE AND TWO-HOUR FIRE RESISTANCE RATED ASSEMBLY

1. Framing Members - Dricon® lumber, minimum 2x4 in. nominal wood studs, spaced maximum 16 in. OC.
2. Gypsum Board – Minimum ⅝ in. thick type X gypsum wallboard, 4 ft wide, conforming to ASTM C1396. Two layers applied vertically. Face layer joints staggered from base layer.
   a. Base layer - Nailed to wood studs and bearing plates 6 in. OC with 6d nails min. 1⅛ in. long.
   b. Face layer - Nailed to studs and bearing plates over the base layer with 8d drywall nails min. 2⅛ in. long and spaced 8 in. OC (face nails staggered from base nails).
3. Gypsum board joints and nail heads - (face layer only) covered with tape and joint compound. Nail heads covered with joint compound.
4. Insulation – Faced or unfaced glass fiber batts 3½ in. thick, nom. 1.40 pcf (R-15), friction fit in the wall cavity between stude. If 2x6 stude are used, glass fiber batt insulation shall be increased to fill the wall cavity. Insulation may be applied in multiple layers to achieve final thickness.
5. Structural panel sheathing – min. ⅛/32 in. thick Dricon® FRT plywood installed vertically, nailed to wood framing with min. 1½ in. 6d nails spaced 6 in. on the perimeter and 12 in. in the field. All joints backer by framing.
6. Exterior cladding – installed in accordance with manufacturer’s installation instructions
   a. Wood structural panel or lap siding (OSB based), min. ⅝ in. thick.
   b. American Plywood Association rated siding including T1-11 and Series 303 textures, rough sawn, MDO, brushed, channel grooved, and lap siding.
   c. Fiber cement lap or vertical siding. Minimum ⅝ in. thick.
   d. Cementitious stucco
      i. For 2 hour rating from interior only, minimum nominal ⅝ in. Portland cement or synthetic stucco systems with self-turfing metal lath or adhesive base coat.
      ii. For 1 hour rating from exterior, ⅝ in. Portland cement plaster with self-turfing metal lath (measured from the face of studs) on the exterior surface. Plaster mix 1:4 for scratch coat and 1:5 for brown coat, by volume, cement to sand.
   e. Brick veneer, minimum thickness of 2.3 in. meeting the requirements of local code agencies, attached to the studs with corrugated metal wall ties attached to each stud with 8d nails every sixth course of bricks. The installation of brick veneer allows 1 hour rating from exterior.

For SI: 1 inch = 25.4 mm
1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that DRICON® Fire-retardant-treated wood, recognized in ICC-ES evaluation report ESR-1626, has also been evaluated for compliance with the code(s) noted below.

Applicable code edition(s):
- 2019 California Building Code (CBC)
- 2019 California Residential Code (CRC)

For evaluation of applicable chapters adopted by the California Office of Statewide Health Planning and Development (OSHPD) and Division of State Architect (DSA), see Sections 2.1.1 and 2.1.2 below.

2.0 CONCLUSIONS

2.1 CBC:
The DRICON® fire-retardant-treated wood, described in Sections 2.0 through 7.0 of the evaluation report ESR-1626, complies with CBC, provided the design and installation are in accordance with the 2018 International Building Code® (IBC) provisions, noted in the evaluation report.

The DRICON® fire-retardant-treated wood has not been evaluated under Chapter 7A for use in the exterior design and construction of new buildings located in a Fire Hazard Severity Zone within State Responsibility Areas or any Wildland–Urban Interface Fire Area.

2.1.1 OSHPD:
The applicable OSHPD Sections of the CBC are beyond the scope of this supplement.

2.1.2 DSA:
The applicable DSA Sections of the CBC are beyond the scope of this supplement.

2.2 CRC:
The DRICON® fire-retardant-treated wood, described in Sections 2.0 through 7.0 of the evaluation report ESR-1626, complies with CRC, provided the design and installation are in accordance with the 2018 International Residential Code® (IRC) provisions, noted in the evaluation report.

The DRICON® fire-retardant-treated wood has not been evaluated under CRC Section R337 for use in the exterior design and construction of new buildings located in a Fire Hazard Severity Zone within State Responsibility Areas or any Wildland–Urban Interface Fire Area.

The DRICON® fire-retardant-treated wood recognized in this supplement has not been evaluated for compliance with the International Wildland–Urban Interface Code®.

This supplement expires concurrently with the evaluation report, issued February 2020.
