3.0 DESCRIPTION

3.1 USG Structural Panel Concrete Subfloor:

USG Structural Panel Concrete Subfloor is formed from a composite consisting of glass fibers, cementitious materials and aggregate. USG Structural Panel Concrete Subfloor is nominally 3/4 inch (19.1 mm) thick, 4 feet (1219 mm) wide, and 8 feet (2428 mm) long with tongue-and-groove edges along the length of the panel.

Based on tests in accordance with ASTM E136, the panels are noncombustible. The panels yield a flame-spread index of 0 and a smoke-developed index of 5 or less when tested in accordance with ASTM E84.

3.2 Floor Framing:

Floor framing, web stiffeners, and blocking must be cold-formed from steel complying with AISI S100 (AISI-General for the 2006 IBC), with a minimum base-metal thickness of 54 mils [0.0538 inch (1.37 mm)], a minimum yield strength of 50 ksi (345 MPa), and a minimum G60 galvanized coating. The supporting flange of the framing member must be at least 1.625 inches (41 mm) wide.

3.3 Blocking:

When blocking is required, as shown in Tables 2 and 3, it must consist of Minimum Grade 33 cold-formed steel straps which are 4 inches (102 mm) wide with a minimum base steel thickness of 54 mils [0.0538 inch (1.37 mm)], and a minimum G60 galvanized coating.

3.4 Fasteners:

The panels must be fastened to the cold-formed steel framing and blocking with Grabber Construction Products, Inc., #8 x 1 5/8" winged self-drilling screws, Part No. CGH8158LG, recognized in ESR-4223.
For horizontal diaphragms constructed with the USG Structural Panel Concrete Subfloor, the length-to-width aspect ratio of the diaphragm must be no greater than 3:1 for unblocked diaphragms and 4:1 for blocked diaphragms. Diaphragm classification as flexible or rigid must be determined in accordance with Section 12.3.1 of ASCE 7.

Diaphragm design must consider diaphragm loading parallel and perpendicular to the floor framing. For select configurations, the results of testing of simple beam assemblies, are shown in Table 2. These values are applicable when the diaphragm load is parallel to the framing members. Results of testing of cantilever assemblies are shown in Table 3. These values apply to diaphragm loads which are parallel and perpendicular to the framing, except where loading parallel to framing is addressed in Table 2. The values in Tables 2 and 3 are nominal diaphragm shear values, which must be adjusted for use in ASD or LRFD, in accordance with the footnotes to the tables. A safety factor, Ω = 2.80 must be used for ASD and a resistance factor, Φ = 0.60 must be used for LRFD.

4.1.3.2 Deflections: Diaphragm deflection must be calculated as follows:

\[ \Delta = \frac{5VL^3}{8EAb} + \frac{VL}{4Et} + XLe_n \]

where:

- \( \Delta \) = Diaphragm deflection, inch
- \( V \) = Unit shear in the direction under consideration, plf
- \( L \) = Diaphragm length, feet
- \( E \) = Elastic modulus of steel rim members designed as diaphragm chords, 29,500,000 psi
- \( A \) = Net area of steel rim chord cross section, in\(^2\)
- \( b \) = Diaphragm width, feet
- \( G \) = Shear modulus of sheathing, 285,714 psi
- \( t \) = Effective thickness of sheathing, 0.73 inch
- \( X \) = Slip coefficient from Table 2 or 3, as applicable

\( e_n \) = Fastener slip, which is based on the ratio of \( V/S_u \) as follows:

- \( e_n = 0.011 \) inch at \( 0.20S_u \)
- \( e_n = 0.019 \) inch at \( 0.33S_u \)
- \( e_n = 0.032 \) inch at \( 0.60S_u \)
- \( e_n = 0.084 \) inch at \( S_u \)

where:

- \( S_u \) = Nominal shear strength given in Table 2 or 3, as applicable

Other values of \( e_n \) are permitted to be determined by interpolation.

4.2 Installation:

4.2.1 General: Installation of USG Structural Panel Concrete Subfloor and framing must be in accordance with the IBC, this report, USG’s published installation instructions and the approved plans. Copies of this report, USG’s published installation instructions and the approved plans must be available at the jobsite at all times during installation of the panels.

4.2.2 Framing: The floor framing must be supported on a foundation that is uniform and level, or directly by bearing studs or headers installed at the top of the bearing wall to distribute the load.

Web stiffeners must be provided at reaction points and/or concentrated loads as specified in the approved plans, based on the framing manufacturer’s requirements and the applicable ICC-ES evaluation report on the framing members. End blocking must be provided where joists ends are not otherwise restrained from rotation.

Floor framing must be provided at a spacing indicated in the tables in this report. Additional framing must be provided under parallel partitions and around all openings that interrupt one or more spanning members. Framing members must be fastened to the supporting walls or structure in accordance with the approved plans.

All blocking or bridging for the steel framing must be installed prior to the installation of the USG Structural Panel Concrete Subfloor.

Framing must comply with the manufacturing tolerances specified in the code.

When blocking is required at the abutting edges of the panels, it must be centered under the longitudinal joints between sheathing panels, and installed prior to installation of the sheathing panels.

4.2.3 USG Structural Panel Concrete Subfloor Application:

4.2.3.1 General: The temperature during panel installation must be a minimum of 0°F (18°C).

4.2.3.2 Panel Layout: USG Structural Panel Concrete Subfloor must be installed with the long edges perpendicular to the framing. Panels may be installed with either surface against the framing. However, because the panel markings that facilitate fastening are on one side only, the panels should preferably be applied with the markings toward the installer.

Panel installation must commence by marking a line across the framing members parallel to the rim joist at a distance equal to the width of the first panel being placed. The panel layout must be planned so the first and last panel row width is a minimum of 24 inches (610 mm).

The cut edge or tongue must be placed along the rim joist. Each panel must be supported across three or more framing members. Panels must be trimmed to ensure that the butted ends of each panel are centered on the framing member flanges.

Adjacent panels must be butted together so that the tongue of one panel being installed fits into the groove of the installed panel. No gaps are required between panels. Panel rows must be placed in a running bond pattern so that end joints fall over the center of the framing members and are staggered by at least two framing members from where the end joints fall in the adjacent rows, except when panels less than 8 feet (2440 mm) long are used, in which case an offset of one framing member is allowed.

4.2.3.3 Panel Fastening: Each panel must be fastened to the framing members in accordance with the requirements for the applicable screw pattern shown in Tables 2 and 3, and in accordance with the fastening schedule specified in the approved plans. Fastening must commence at one end and fan out across the panel, and corners must not be fastened initially. Fasteners must be placed sequentially one row at a time. Screws must be installed using tools recommended by the screw manufacturer. Screw fasteners must be installed so the heads are flush with the panel surface. Panels must be fastened in accordance with one of the following patterns, as required by Tables 2 and 3:

- **Screw Pattern A**: Sheathing must be fastened at 4, 6 or 8 inches (102, 152 or 203 mm) on center at the perimeter of the diaphragm and at the panel-to-panel butt joints, as required by Tables 2 and 3. At the panel corners,
fasteners must be inset 2 inches (51 mm). In the field of the panel, fasteners must be spaced a maximum of 12 inches (305 mm) on center. Fastener edge distance at all panel edges must be a minimum of 1/2 inch (12.7 mm), except at T-joints (intersection of butt joint with tongue-and-groove joint) where two fasteners are required, one placed 1 inch (25.4 mm) and another at 2 inches (51 mm) from the panel edge. Figure 1 illustrates the Screw Pattern A fastener layout.

- **Screw Pattern B**: Sheathing must be fastened at 4, 6 or 8 inches (102, 152 or 203 mm) on center at the perimeter of the diaphragm and at the panel-to-panel butt joints, as required by Tables 2 and 3. At the panel corners, fasteners must be inset 2 inches (51 mm). In the field of the panel, fasteners must be spaced a maximum of 12 inches (305 mm) on center. Fastener edge distance at all panel edges must be a minimum of 1/2 inch (12.7 mm), except at T-joints where one fastener must be placed 1 inch (25.4 mm) from the panel edge. Figure 2 illustrates the Screw Pattern B fastener layout.

- **Screw Pattern C**: Sheathing must be fastened at 6 inches (152 mm) on center at the perimeter of the diaphragm, at the panel-to-panel butt joints, and at blocking the tongue-and-groove joints. At the panel corners, fasteners must be inset 2 inches (51 mm), with an additional fastener installed at the T-joint. In the field of the panel, fasteners must be spaced a maximum of 12 inches (305 mm) on center. Fastener edge distance at panel edges parallel to framing and at cut edges must be a minimum of 1/2 inch (12.7 mm). Fastener edge distance at tongue and groove panel joint over blocking must be a minimum of 1 inch (25.4 mm). Figure 3 illustrates the Screw Pattern C fastener layout.

4.2.3.4 Field Modifications: As needed, the panels must be cut to proper length and width in accordance with USG’s installation instructions.

Cut-outs in the panels must be created before installation of the panels. All cut-out ends and edges exceeding 6 inches (152 mm) in any dimension must be supported by framing.

4.2.4 Floor Finish: Before application of floor finish materials, all structural panels must be completely fastened. All voids and depressions in the panel surface must be filled with cement-based patching or leveling compounds. Panel surfaces must be clean and free of moisture.

Before application of floor finish materials, USG Structural Panel Concrete Subfloor must be conditioned in the same environment as required for the finish floors, if applicable, for at least 48 hours.

Underlayments must be secured to USG Structural Panel Concrete Subfloor with fastenings specified for the flooring material. Mechanical fasteners must be long enough to penetrate the USG Structural Panel Concrete Subfloor 1/4 to 1/2 inch (6.4 to 12.7 mm).

For wood flooring, No. 15 felt or equivalent must first be laid over the USG Structural Panel Concrete Subfloor. For engineered wood flooring, the specified moisture barrier must be used in lieu of the felt. The USG Structural Panel Concrete Subfloor must be kept dry and maintained in a conditioned space for a minimum of 30 days prior to the installation of wood flooring. The wood flooring must then be installed in accordance with the wood flooring manufacturer’s installation instructions for application over wood floor sheathing.

Tackless strips, designed for concrete application, must be used for the installation of stretched carpet.

4.3 Special Inspections: For the purpose of determining special inspection requirements, the floor systems described in this report must be considered special cases, in accordance with Section 1705.1.1 of the IBC (2009 IBC Section 1704.15). Inspection of diaphragm construction is required when the fastener spacing is less than or equal to 4 inches (102 mm).

5.0 CONDITIONS OF USE

The USG Structural Panel Concrete Subfloor described in this report complies with, or is a suitable alternative to what is specified in, the codes indicated in Section 1.0 of this report, subject to the following conditions:

5.1 The product must be installed in accordance with this report, the manufacturer’s published instructions, the approved plans and the applicable code. In the event of a conflict amongst these documents, the most restrictive requirements govern.

5.2 Calculations and details showing that the applied gravity loads do not exceed the uniform load capacity, and that the applied diaphragm loads do not exceed the available diaphragm strengths specified in this report, must be submitted to the code official for approval. The calculations must be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.

5.3 Design of the supporting building foundation system, walls or roof is outside the scope of this report.

5.4 The USG Structural Panel Concrete Subfloor is manufactured under a quality control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

6.1 Data in accordance with the ICC-ES Acceptance Criteria for Structural Cementitious Floor and Roof Sheathing Panels (AC318), dated March 2018.

6.2 Data in accordance with the ICC-ES Acceptance Criteria for Horizontal Diaphragms Consisting of Structural Cementitious Sheathing Panels Attached to Cold-formed Steel Framing (AC319), dated March 2018.

7.0 IDENTIFICATION

7.1 Each panel is labeled with the USG Structural Panel Concrete Subfloor brand name; the United States Gypsum Company name and address; the panel thickness; the maximum framing spacing for the panel (referred to as maximum span); the maximum allowable load (uniform live and dead gravity load); the ICC-ES report number (ESR-1792); and the date of manufacture.

7.2 The report holder’s contact information is the following:

REPORT HOLDER:
UNITED STATES GYPSUM COMPANY

EVALUATION SUBJECT:
USG STRUCTURAL PANEL CONCRETE SUBFLOOR

1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that the USG Structural Panel Concrete Subfloor, described in ICC-ES master evaluation report ESR-1792, has also been evaluated for compliance with the codes noted below as adopted by the Los Angeles Department of Building and Safety (LADBS).

Applicable code editions:
- 2017 City of Los Angeles Building Code (LABC)
- 2017 City of Los Angeles Residential Code (LARC)

2.0 CONCLUSIONS

The USG Structural Panel Concrete Subfloor, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1792, complies with the LABC and the LARC and is subject to the conditions of use described in this supplement.

3.0 CONDITIONS OF USE

The USG Structural Panel Concrete Subfloor described in this evaluation report must comply with all of the following conditions:

- All applicable sections in the master evaluation report ESR-1792.
- The design, installation, conditions of use and identification of the USG Structural Panel Concrete Subfloor are in accordance with the 2015 International Building Code® (2015 IBC) provisions noted in the master evaluation report ESR-1792.
- The design, installation and inspection are in accordance with additional requirements of LABC Chapters 16 and 17, as applicable.
- Under the LARC, an engineered design in accordance with LARC Section R301.1.3 must be submitted.

This supplement expires concurrently with the master report, issued January 2019 and revised July 2019.
1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that the USG Structural Panel Concrete Subfloor, described in ICC-ES master evaluation report ESR-1792, has also been evaluated for the codes noted below.

Applicable code edition:
- 2016 California Building Code (CBC)
- 2016 California Residential Code (CRC)

2.0 CONCLUSIONS

The USG Structural Panel Concrete Subfloor, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1792, complies with CBC and CRC Section R301.1.3, provided the design and installation are in accordance with the 2015 International Building Code® (IBC) provisions noted in the master report, and the additional design and inspection requirements of the CBC Chapter 16 and Section 1705.1.1.

2.1 OSHPD:
The USG Structural Panel Concrete Subfloor, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1792, satisfies CBC amended Section 104.11, provided the design and installation are in accordance with the 2015 International Building Code® (IBC) provisions noted in the master report, and the additional requirements in Sections 2.1.1 and 2.1.2 of this supplement:

2.1.1 Special Inspection Requirements: Special inspection shall be required in accordance with Section 1705.1.1 [OSHPD 2] or Section 1705A.1.1 [OSHPD 1 & 4] of the CBC, as applicable.

2.1.2 Conditions of Use: Framing must comply with the manufacturing tolerances specified in Section A5.4 of AISI S200-12, which is referenced in Section 22.11.1 [OSPHD 2] or Section 2211.1A [OSHPD 1 & 4] of the CBC, as applicable.

2.2 DSA:
The USG Structural Panel Concrete Subfloor, described in Sections 2.0 through 7.0 of the master evaluation report ESR-1792, satisfy CBC amended Section 104.11, provided the design and installation are in accordance with the 2015 International Building Code® (IBC) provisions noted in the master report, and the additional requirements in Sections 2.2.1 to 2.2.2 of this supplement:

2.2.1 Special Inspection Requirements: Special inspection shall be required in accordance with Section 1705A.1.1 [DSA-SS & SS/CC] of the CBC.

2.2.2 Conditions of Use: Framing must comply with the manufacturing tolerances specified in Section A5.4 of AISI S200-12, which is referenced in Section 2211A.1 [DSA-SS] or Section 2211.1 [DSA SS/CC] of the CBC, as applicable.

This supplement expires concurrently with the master report, reissued January 2019 and revised July 2019.
