Section: 03 16 00—Concrete Anchors

DIVISION: 05 00 00—METALS
Section: 05 05 19—Post-Installed Concrete Anchors

REPORT HOLDER:
SIMPSON STRONG-TIE COMPANY INC.

EVALUATION SUBJECT:
TITEN HD® SCREW ANCHOR AND TITEN HD® ROD HANGER FOR CRACKED AND UNCRACKED CONCRETE

1.0 EVALUATION SCOPE

Compliance with the following codes:

For evaluation for compliance with codes adopted by Los Angeles Department of Building and Safety (LADBS), see ESR-2713 LABC and LARC Supplement.

Property evaluated:
Structural

2.0 USES

The Simpson Strong-Tie® Titen HD® Screw Anchor is used as anchorage to resist static, wind and seismic (Seismic Design Categories A through F) tension and shear loads in cracked and uncracked normal-weight concrete and lightweight concrete members having a specified compressive strength, $f'_{c}$, from 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa); and cracked and uncracked sand-lightweight or normal-weight concrete over profile steel deck having a minimum specified compressive strength, $f'_{c}$, of 3,000 psi (20.7 MPa).

The Simpson Strong-Tie® Titen HD® Rod Hanger is used as anchorage to resist static, wind and seismic (Seismic Design categories A through F) tension loads in cracked and uncracked normal-weight concrete and lightweight concrete members having a specified compressive strength, $f'_{c}$, from 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa); and cracked and uncracked sand-lightweight or normal-weight concrete over profile steel deck having a minimum specified compressive strength, $f'_{c}$, of 3,000 psi (20.7 MPa).

The 1/4-inch-diameter (6.4 mm) and 3/8-inch-diameter (9.5 mm) screw anchors and rod hangers may be installed in the topside of cracked and uncracked normal-weight or sand-lightweight concrete-filled steel deck having a minimum member thickness, $h_{min,deck}$, as noted in Table 4 of this report, and a specified compressive strength, $f'_{c}$, of 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa).

The Simpson Strong-Tie® Titen HD® Screw Anchors and Rod Hangers are alternatives to anchors described in Section 1901.3 of 2018 and 2015 IBC, Sections 1908 and 1909 of the 2012 IBC and Sections 1911 and 1912 of the 2009 and 2006 IBC. The anchors may also be used where an engineered design is submitted in accordance with Section R301.1.3 of the IRC.

3.0 DESCRIPTION

3.1 Titen HD® Screw Anchor:
The Titen HD® Screw Anchor is a carbon steel threaded anchor with a hex-washer head or with a countersunk head. The screw anchor is manufactured from heat-treated steel complying with SAE J403 Grade 10B21, and has an electrodeposited coating of zinc, minimum thickness 0.0002 inch (5 µm) in accordance with ASTM B633, SC1, Type III. Titen HD® Screw Anchors are available with nominally 1/4-, 3/8-, 1/2-, 5/8-, and 3/4-inch shank diameters with a hex-washer head and with 1/4- and 3/8-inch shank diameters with a countersunk head, as well as various lengths in each diameter. Figure 1A illustrates a typical Titen HD® Screw Anchor.

3.2 Titen HD® Rod Hanger:
The Titen HD® Rod Hanger is a carbon steel threaded anchor with an oversized hex-washer head that is internally threaded. The rod hanger is manufactured from heat-treated steel complying with SAE J403 Grade 10B21, and has an electrodeposited coating of zinc, minimum thickness 0.0002 inch (5 µm), in accordance with ASTM B633, SC1, Type III. The Titen HD® Rod Hanger is available with a nominally 1/4-inch shank diameter with 1/4-inch or 3/8-inch diameter (6.4 mm or 9.5 mm) internal threads, and 3/8-inch shank diameter with 3/8-inch (9.5 mm) and 10 mm diameter internal threads or 1/2-inch-diameter (12.7 mm) internal threads. Figure 1B illustrates the Titen HD® Rod Hanger. Refer to Table 6 for catalog number information.

3.3 Concrete:
Normal-weight and lightweight concrete must comply with Sections 1903 and 1905 of the IBC.
3.4 Profile Steel Deck:
The profile steel deck must comply with the configuration in Figures 3, 4, and 5 of this report and have a minimum base steel thickness of 0.035 inch (0.889 mm). Steel deck in Figure 3 must comply with ASTM A653/A653M SS Grade 33, and have a minimum yield strength of 33 ksi (228 MPa). Steel deck in Figures 4 and 5 must comply with ASTM A653/A653M SS Grade 50, and have a minimum yield strength of 50 ksi (345 MPa).

4.0 DESIGN AND INSTALLATION

4.1 Strength Design:

4.1.1 General: Design strength of anchors complying with the 2018 and 2015 IBC as well as Section R301.1.3 of the 2018 and 2015 IRC, must be determined in accordance with ACI 318-14 Section 17 and this report. The design strength of anchors complying with the 2012 IBC, as well as Section R301.1.3 of the 2012 IRC, must be determined in accordance with ACI 318-11 Appendix D and this report.

The design strength of anchors complying with the 2009 IBC, as well as Section R301.1.3 of the 2009 IRC, must be determined in accordance with ACI 318-08 Appendix D and this report.

The design strength of anchors complying with the 2006 IBC and 2005 IRC must be in accordance with ACI 318-05 Appendix D and this report.

The strength design of anchors must comply with ACI 318-14 17.3.1 or ACI 318-11 D.4.1, as applicable, except as required in ACI 318-14 17.2.3 or ACI 318-11 D.3.3. Strength reduction factors, \( \phi \), as given in ACI 318-14 17.3.3 or ACI 318-11 D.4.3, as applicable, and noted in Tables 2 and 3 of this report, must be used for load combinations calculated in accordance with Section 1605.2.1 of the IBC and Section 5.3 of ACI 318-14 or Section 9.2 of ACI 318-11, as applicable. Strength reduction factors, \( \phi \), as given in ACI 318-11 D.4.4, must be used for load combinations calculated in accordance with ACI 318 Appendix C. The value of \( f_y \), used in the calculations must be limited to a maximum of 8,000 psi (55.2 MPa), in accordance with ACI 318-14 17.2.7 or ACI 318-11 D.3.7, as applicable.

4.1.2 Requirements for Static Steel Strength in Tension:
The nominal steel strength of a single anchor in tension, \( N_{sa} \), calculated in accordance with ACI 318-14 17.4.1.2 or ACI 318-11 D.5.1.2, as applicable, is given in Table 2 of this report. The strength reduction factor, \( \phi \), corresponding to a brittle steel element must be used for all anchors, as given in Table 2.

4.1.3 Requirements for Static Concrete Breakout Strength in Tension:
The nominal concrete breakout strength of a single anchor or a group of anchors in tension, \( N_{bo} \) or \( N_{bo,gr} \), respectively, must be calculated in accordance with ACI 318-14 17.4.2.2 or ACI 318-11 D.5.2.2, as applicable, with modifications as described in this section. The basic concrete breakout strength of a single anchor in tension in cracked concrete, \( N_b \), must be calculated in accordance with ACI 318-14 17.4.2.2 or ACI 318-11 D.5.2.2, as applicable, with the values of \( h_{orf} \) and \( k_{or} \) as given in Table 2 of this report. The nominal concrete breakout strength in tension in regions where analysis indicates no cracking in accordance with ACI 318-14 17.4.2.6 or ACI 318-11 D.5.2.6, as applicable, must be calculated with the value of \( k_{or} \) as given in Table 2 of this report and with \( \Psi_{L,N} = 1.0 \).

Determination of concrete breakout strength in accordance with ACI 318-14 17.4.2 or ACI 318-11 D.5.2 is not required for anchors installed in the lower flute or upper flute of the soffit of profile steel deck floor and roof assemblies with sand-lightweight or normal-weight concrete fill as shown in Figures 3 or 4.

4.1.4 Requirements for Static Pullout Strength in Tension:
The nominal pullout strength of a single anchor or a group of anchors in tension in accordance with ACI 318-14 17.4.3.1 and 17.4.3.2 or ACI 318-11 D.5.3.1 and D.5.3.2, as applicable, in cracked and uncracked concrete, \( N_{po} \) and \( N_{po,uncr} \), respectively, is given in Table 2 of this report and must be used in lieu of \( N_{p} \). In regions of a concrete member where analysis indicates no cracking at service level loads in accordance with ACI 318-14 17.4.3.6 or ACI 318-11 D.5.3.6, as applicable, the nominal pullout strength in uncracked concrete, \( N_{po,uncr} \), applies. Where values for \( N_{po} \) or \( N_{po,uncr} \) are not provided in Table 2, the pullout strength does not need to be considered in design.

The nominal pullout strength in cracked concrete for anchors installed in the lower flute or upper flute of the soffit of sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies as shown in Figures 3 and 4, \( N_{po,deck,cr} \), in accordance with Table 5, \( N_{po,deck,cr} \), must be used in lieu of \( N_{po} \). In regions of a concrete member where analysis indicates no cracking in accordance with ACI 318-14 17.4.3.6 or ACI 318-11 D.5.3.6, as applicable, the nominal pullout strength in uncracked concrete \( N_{po,deck,uncr} \) applies in lieu of \( N_{po,uncr} \). The value of \( \Psi_{L,N} \) equals 1.0 for all design cases.

4.1.5 Requirements for Static Steel Strength in Shear:
The nominal steel strength in shear, \( V_{sa} \), of a single screw anchor in accordance with ACI 318-14 17.5.1.2 or ACI 318-11 D.6.1.2, as applicable, is given in Table 3 of this report and must be used in lieu of the values derived by calculation from ACI 318-14 Eq. 17.5.1.2a or ACI 318-11 Eq. D-29, as applicable. The strength reduction factor, \( \phi \), corresponding to a brittle steel element must be used for all anchors, as described in Table 3.

The nominal shear strength, \( V_{sa,deck} \), of a single screw anchor installed in the lower flute or upper flute of the soffit of sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figures 3 and 4, is given in Table 5.

4.1.6 Requirements for Static Concrete Breakout Strength in Shear:
The nominal concrete breakout strength in shear of a single screw anchor or group of screw anchors, \( V_{cb} \) or \( V_{cb,gr} \), respectively, must be calculated in accordance with ACI 318-14 17.5.2.2 or ACI 318-11 D.6.2.2, as applicable, with modifications as described in this section. The basic concrete breakout strength in shear of a single screw anchor in cracked concrete, \( V_{b} \), must be calculated in accordance with ACI 318-14 17.5.2.2 or ACI 318-11 D.6.2.2, as applicable, using the values of \( l_c \) and \( d_a \) as given in Table 3 of this report. The modification factors in ACI 318-14 17.5.2.4, 17.5.2.5, 17.5.2.6 and 17.5.2.7 ACI 318-11 D.6.2.4, D.6.2.5, D.6.2.6 and D.6.2.7 must be applied to the basic breakout strength in shear, \( V_{b} \), as applicable.

For anchors installed in the topside of concrete-filled steel deck assemblies, as shown in Figure 5, the nominal concrete breakout strength of a single anchor or group of
anchors in shear, $V_{cb}$ or $V_{cdb}$, respectively, must be calculated in accordance with ACI 318-14 17.5.2 or ACI 318-11 D.6.2, as applicable, using the actual member thickness, $h_{min, deck}$, in the determination of $A_{cp}$. Minimum topping thickness for anchors in the topside of concrete-filled steel deck assemblies is given in Table 4 of this report.

Calculation of the concrete breakout strength in accordance with ACI 318-14 17.5.2 or ACI 318-11 D.6.2, as applicable, is not required for screw anchors installed in the lower flute or upper flute of the soffit of sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figures 3 and 4.

### 4.1.7 Requirements for Static Concrete Pryout Strength in Shear

The nominal concrete pryout strength for a single screw anchor or group of screw anchors, $V_{cp}$ or $V_{cdp}$, respectively, must be calculated in accordance with ACI 318-14 17.5.3 or ACI 318-11 D.6.3, as applicable, using the coefficient for pryout strength, $k_{cp}$, provided in Table 3 of this report and the value of nominal breakout strength in tension of a single screw anchor or group screw anchors, $N_{cb}$ or $N_{cdp}$, as calculated in Section 4.1.3 of this report.

For anchors installed in the lower flute or upper flute of the soffit of sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figures 3 and 4, calculation of the concrete pryout strength in accordance with ACI 318-14 17.5.3 or ACI 318-11 D.6.3, as applicable, is not required.

### 4.1.8 Requirements for Seismic Design

#### 4.1.8.1 General

When the screw anchor design includes seismic loads, the design must be performed in accordance with ACI 318-14 17.2.3 or ACI 318-11 D.3.3.3, as applicable. Modifications to ACI 318-14 17.2.3 shall be applied under Section 1905.1.8 of the 2018 and 2015 IBC. Under the 2012 IBC, Section 1905.1.8 shall be omitted. Modifications to ACI 318-08 and 318-05 D.3.3.3, as applicable, shall be applied under Section 1908.1.16 of the 2009 IBC, Section 1908.1.16 of the 2006 IBC.

Except for use in Seismic Design Category A or B of the IBC, design strengths must be determined presuming the concrete is cracked unless it can be demonstrated that the concrete remains uncracked.

The nominal steel strength and nominal concrete breakout strength of screw anchors in tension, and the nominal concrete breakout strength and pryout strength of screw anchors in shear, must be calculated according to ACI 318-14 17.4 and 17.5 ACI 318-11 D.5 and D.6, as applicable, respectively, taking into account the corresponding values in Tables 1 through 5 of this report.

The screw anchors comply with ACI 318-14 2.3 or ACI 318-11 D.1, as applicable, as brittle steel elements and must be designed in accordance with ACI 318-08 D.3.3.5 or D.3.3.6 or ACI 318-05 D.3.3.5, as applicable.

#### 4.1.8.2 Seismic Tension

The nominal steel strength and concrete breakout strength in tension must be determined in accordance with ACI 318-14 17.4.1 and 17.4.2 or ACI 318-11 D.5.1 and D.5.2, as applicable, described in Sections 4.1.2 and 4.1.3 of this report. In accordance with ACI 318-14 17.4.3.2 or ACI 318-11 D.5.3.2, as applicable, the appropriate value for nominal pullout strength in tension for seismic loads, $N_{eq,p}$ or $N_{eq,deck,p}$, described in Tables 2 and 5 of this report, must be used in lieu of $N_{p}$.

#### 4.1.8.3 Seismic Shear

The nominal concrete breakout and concrete pryout strength in shear must be determined in accordance with ACI 318-14 17.5.2 and 17.5.3 or ACI 318-11 D.6.2 and D.6.3, as applicable, as described in Sections 4.1.6 and 4.1.7 of this report. In accordance with ACI 318-14 17.5.1.2 or ACI 318-11 D.6.1.2, as applicable, the appropriate value for nominal steel strength in shear for seismic loads, $V_{sa,eq}$ or $V_{sa,deck,eq}$ described in Tables 3 and 5 of this report, must be used in lieu of $V_{sa}$.

#### 4.1.9 Interaction of Tensile and Shear Forces

Screw anchors or groups of screw anchors that are subjected to combined axial (tensile) and shear loadings must be designed in accordance with ACI 318-14 17.6 or ACI 318-11 D.7, as applicable.

#### 4.1.10 Requirements for Minimum Member Thickness, Minimum Anchor Spacing and Minimum Edge Distance

In lieu of ACI 318-14 17.7.1 and 17.7.3 or ACI 318-11 D.8.1 and D.8.3, as applicable, values of $c_{mn}$ and $s_{min}$ provided in Table 1 of this report must be used. In lieu of ACI 318-14 17.7.5 or ACI 318-11 D.8.5, minimum member thickness, $h_{min}$, must comply with Table 1 of this report, as applicable.

For anchors installed in the topside of normal-weight or sand-lightweight concrete over profile steel deck floor and roof assemblies, installation parameters are provided in Table 4 and Figure 5 of this report.

For anchors installed in the lower flute or upper flute of the soffit of sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, details in Figures 3 and 4 must be observed. The minimum anchor spacing along the flute must be the greater of 3$h_{net}$ or 1.5 times the flute width.

#### 4.1.11 Requirements for Critical Edge Distance

In applications where $c < c_{ac}$ and supplemental reinforcement to control splitting of the concrete is not present, the concrete breakout strength in tension for uncracked concrete, calculated according to ACI 318-14 17.4.2 or ACI 318-11 D.5.2, as applicable, must be further multiplied by the factor $\psi_{cp,N}$ given by Eq-1:

$$\psi_{cp,N} = \frac{c}{c_{ac}}$$

(Eq-1)

whereby the factor $\psi_{cp,N}$ need not be taken less than $1.5h_{net}$. For all other cases, $\psi_{cp,N} = 1.0$. In lieu of using ACI 318-14 17.7.6 or ACI 318-11 D.8.6, as applicable, values of $c_{ac}$ provided in Tables 1 and 4 of this report must be used.

#### 4.1.12 Lightweight Concrete

For the use of anchors in lightweight concrete, the modification factor $\lambda = 0.8 \lambda$ applied to all values of $\sqrt{f'_c}$ affecting $N_p$ and $V_q$.

For ACI 318-14 (2018 and 2015 IBC), ACI 318-11 (2012 IBC) and ACI 318-08 (2009 IBC), $\lambda$ shall be determined in accordance with the corresponding version of ACI 318.

For ACI 318-05 (2006 IBC), $\lambda$ shall be taken as 0.75 for all lightweight concrete and 0.85 for sand-lightweight concrete. Linear interpolation shall be permitted if partial sand replacement is used. In addition, the pullout strengths $N_{po}, N_{po,uncr}$, and $N_{eq}$ shall be multiplied by the modification factor, $\lambda$, as applicable.

For anchors installed in the soffit of sand-lightweight concrete-filled steel deck and floor and roof assemblies, further reduction of the pullout values provided in this report is not required.
4.2 Allowable Stress Design (ASD):

4.2.1 General: Where design values for use with allowable stress design (working stress design) load combinations in accordance with Sections 1605.3 of the IBC are required, these are calculated using Eq-2 and Eq-3 as follows:

\[ T_{allowable, ASD} = \frac{\phi N_t}{\alpha} \quad \text{(Eq-2)} \]

and

\[ V_{allowable, ASD} = \frac{\phi V_n}{\alpha} \quad \text{(Eq-3)} \]

where:

- \( T_{allowable, ASD} \) = Allowable tension load, (lbf, N)
- \( V_{allowable, ASD} \) = Allowable shear load, (lbf, N)
- \( \phi N_t \) = Lowest design strength of an anchor or anchor group in tension as determined in accordance with ACI 318-14 Chapter 17 or ACI 318 (-11, -08, -05) Appendix D, as applicable, and 2018 and 2015 IBC Section 1905.1.8, 2009 IBC Section 1908.1.9, or 2006 IBC Section 1908.1.16, as applicable, and Section 4.1 of this report, as applicable (lbf or N). For the 2012 IBC, Section 1905.1.9 shall be omitted.
- \( \phi V_n \) = Lowest design strength of an anchor or anchor group in shear as determined in accordance with ACI 318-14 Chapter 17 or ACI 318 (-11, -08, -05) Appendix D, as applicable, and 2018 and 2015 IBC Section 1905.1.8, 2009 IBC Section 1908.1.9, or 2006 IBC Section 1908.1.16, as applicable, and Section 4.1 of this report, as applicable (lbf or N). For the 2012 IBC, Section 1905.1.9 shall be omitted.
- \( \alpha \) = A conversion factor calculated as a weighted average of the load factors for the controlling load combination. In addition, \( \alpha \) must include all applicable factors to account for nondestructive failure modes and required over-strength.

The requirements for member thickness, edge distance and spacing, described in Tables 1 and 4 of this report, must apply.

4.2.2 Interaction of Tensile and Shear Forces: The interaction of tension and shear loads must be consistent with ACI 318-14 17.6 or ACI 318-11 D.7, as applicable, as follows:

If \( T_{applied} \leq 0.2 T_{allowable, ASD} \), then the full allowable strength in shear, \( V_{allowable, ASD} \), shall be permitted.

If \( V_{applied} \leq 0.2 V_{allowable, ASD} \), then the full allowable strength in tension, \( T_{allowable, ASD} \), shall be permitted.

For all other cases:

\[ \frac{T_{applied}}{T_{allowable, ASD}} + \frac{V_{applied}}{V_{allowable, ASD}} \leq 1.2 \quad \text{(Eq-4)} \]

4.3 Installation:

Installation parameters are provided in Tables 1 and 4, and Figures 2, 3, 4 and 5. Anchor locations must comply with this report, and the plans and specifications approved by the code official. The Titen HD® Screw Anchors and Rod Hangers must be installed in accordance with the manufacturer’s published instructions and this report. Anchors must be installed by drilling a pilot hole into the concrete using a handheld electro-pneumatic rotary hammer drill with a carbide-tipped drill bit conforming to ANSI B212.15-1994. The pilot hole must have the same nominal diameter as the nominal diameter of the anchor.

For the \( \frac{1}{4} \)-inch (6.4 mm) Titen HD® Screw Anchors and \( \frac{1}{4} \)-inch (6.4mm) shank diameter Rod Hangers, the hole is drilled to the specified nominal embedment depth plus \( \frac{1}{8} \)-inch (3.2 mm). For the \( \frac{3}{8} \)-inch (9.5 mm) Titen HD® Screw Anchors and \( \frac{3}{8} \)-inch (9.5 mm) shank diameter Rod Hangers, the hole is drilled to the specified nominal embedment depth plus \( \frac{3}{4} \)-inch (6.4 mm). For \( \frac{1}{2} \)-inch and \( \frac{3}{4} \)-inch (12.7, 15.9 and 19.1 mm) Titen HD® Screw Anchors, the hole is drilled to the specified nominal embedment depth plus \( \frac{1}{2} \)-inch (12.7 mm). Dust and debris in the hole must be removed by using oil-free compressed air. The Titen HD® Screw Anchors and Rod Hangers must be installed into the hole to the specified embedment depth using a socket wrench or powered impact wrench. The maximum installation torque and maximum impact wrench torque rating requirements for the Titen HD® Screw Anchor and Rod Hangers are detailed in Table 1. The Titen HD® Screw Anchors and Rod Hangers may be loosened by a maximum one turn and reinstalled with a socket wrench or powered impact wrench to facilitate fixture attachment or realignment.

For anchors installed in the topside of normal-weight or sand-lightweight concrete over profile steel deck floor and roof assemblies, installation parameters are provided in Table 4 and Figure 5 of this report.

For anchors installed in the lower flute or upper flue of the soffit of sand-lightweight or normal-weight concrete over profile steel deck floor and roof assemblies, the hole diameter in the steel deck must not exceed the diameter of the hole in the concrete by more than \( \frac{1}{8} \)-inch (3.2 mm).

4.4 Special Inspection:

Periodic special inspection is required in accordance with Section 1705.1.1 and Table 1705.3 of the 2018, 2015 or 2012 IBC or Section 1704.15 of the 2009 IBC or Section 1704.13 of the 2006 IBC. The special inspector must make periodic inspections during anchor installation to verify anchor type, anchor dimensions, hole cleaning procedure, embedment depth, concrete type, concrete compressive strength, concrete member thickness, hole dimensions, anchor spacing, edge distance, installation torque, maximum impact wrench torque rating, and adherence to the manufacturer’s published installation instructions. The special inspector must be present as often as required in accordance with the “statement of special inspection.”

Under the IBC, additional requirements as set forth in Section 1705, 1706 or 1707 must be observed, where applicable.

5.0 CONDITIONS OF USE

The Simpson Strong-Tie® Titen HD® Screw Anchors and Rod Hangers described in this report are suitable alternatives to what is specified in those codes listed in Section 1.0 of this report, subject to the following conditions:

5.1 The anchors must be installed in accordance with the manufacturer’s published installation instructions (MPII) and this report. In case of conflict, this report governs.

5.2 Anchor sizes, dimensions and minimum embedment depths are set forth in the tables of this report.

5.3 The anchor must be installed in accordance with Section 4.3 of this report in cracked and uncracked normal-weight and lightweight concrete having a compressive strength, \( f'_c \), of 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa); and cracked and uncracked sand-lightweight or normal-weight concrete over...
profile steel deck having a minimum specified compressive strength, $f_c$, of 3,000 psi (20.7 MPa).

5.4 The 1/4-inch-diameter (6.4 mm) and 3/8-inch-diameter (9.5 mm) anchors may be installed in the topside of cracked and uncracked normal-weight or sand-lightweight concrete-filled steel deck having a minimum specified compressive strength, $f_c$, of 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa).

5.5 The value of $f_c$ used for calculation purposes must not exceed 8,000 psi (55.2 MPa).

5.6 The concrete must have attained its minimum design strength prior to the installation of the anchors.

5.7 Strength design values must be established in accordance with Section 4.1 of this report.

5.8 Allowable stress design values must be established in accordance with Section 4.2 of this report.

5.9 Anchor spacing(s) and edge distance(s), as well as minimum member thickness, must comply with Tables 1, 4 and 5, and Figures 3, 4 and 5 of this report.

5.10 Reported values for the Titen HD® Rod Hanger do not consider the steel insert element which must be verified by the design professional.

5.11 The 1/4-inch-diameter (6.4 mm) and 3/8-inch-diameter (9.5 mm) Titen HD® Screw Anchors may be installed in the topside of cracked and uncracked normal-weight or sand-lightweight concrete-filled steel deck in accordance with Table 4 and as shown in Figure 5.

The 1/4-inch-diameter (6.4 mm), 3/8-inch-diameter (9.5 mm), and 1/2-inch-diameter (12.7 mm) Titen HD® Screw Anchors, and the 1/4-inch (6.4 mm) and 3/8-inch (9.5 mm) shank diameter Titen HD® Rod Hanger may be installed in cracked and uncracked sand-lightweight or normal-weight concrete in the lower flue over profile steel deck in accordance with Table 5 and as shown in Figure 3 for the 3/8-inch-diameter (9.5 mm), 1/2-inch-diameter (12.7 mm) Titen HD® Screw Anchors, and the 3/8-inch (9.5 mm) shank diameter Titen HD® Rod Hanger; and in Figure 4 for the 1/4-inch-diameter (6.4 mm) Titen HD® Screw Anchors and 1/4-inch (6.4 mm) shank diameter Titen HD® Rod Hanger.

The 1/4-inch-diameter (6.4 mm), the 3/8-inch-diameter (9.5 mm) and the 1/2-inch-diameter (12.7 mm) Titen HD® Screw Anchors and 1/4-inch (6.4 mm) shank diameter Titen HD® Rod Hanger may be installed in cracked and uncracked sand-lightweight or normal-weight concrete in the upper flue over profile steel deck in accordance with Table 5 and as shown in Figure 4 for the 1/4-inch-diameter (6.4 mm) Titen HD® Screw Anchor and 1/4-inch (6.4 mm) shank diameter Titen HD® Rod Hanger; in Figure 3 for the 3/8-inch-diameter (9.5 mm) and the 1/2-inch-diameter (12.7 mm) Titen HD® Screw Anchor.

5.12 Prior to installation, calculations and details demonstrating compliance with this report must be submitted to the code official. The calculations and details must be prepared, signed and sealed by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.

5.13 Since an ICC-ES acceptance criteria for evaluating data to determine the performance of anchors subjected to fatigue or shock loading is unavailable at this time, the use of these anchors under such conditions is beyond the scope of this report.

5.14 Anchors may be installed in regions of concrete where cracking has occurred or where analysis indicates cracking may occur ($f_r > f_t$), subject to the conditions of this report.

5.15 Anchors may be used to resist short-term loading due to wind or seismic forces in locations designated as Seismic Design Categories A through F under the IBC, subject to the conditions of this report.

5.16 Anchors are not permitted to support fire-resistance-rated construction. Where not otherwise prohibited by the code, Titen HD® Screw Anchors and Rod Hangers are permitted for installation in fire-resistance-rated construction provided that at least one of the following conditions is fulfilled:

- Anchors are used to resist wind or seismic forces only.
- Anchors that support gravity load–bearing structural elements are within a fire-resistance-rated envelope or a fire-resistance-rated membrane, are protected by approved fire-resistance-rated materials, or have been evaluated for resistance to fire exposure in accordance with recognized standards.
- Anchors are used to support nonstructural elements.

5.17 Anchors have been evaluated for reliability against brittle failure and found to be not significantly sensitive to stress-induced hydrogen embrittlement.

5.18 Use of anchors is limited to dry, interior locations.

5.19 Special inspection must be provided in accordance with Section 4.4.

5.20 The anchors are manufactured by Simpson Strong-Tie® Company, Inc., under an approved quality-control program with inspections by ICC-ES or by a properly accredited inspection agency that has a contractual relationship with ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Mechanical Anchors in Concrete Elements (AC193), dated October 2017, editorially revised April 2018, including an optional suitability test for seismic tension and shear; profile steel deck soffit tests; mechanical properties tests; calculations; and quality-control documentation.

7.0 IDENTIFICATION

7.1 The Titen HD® Screw Anchor and Rod Hanger packaging is marked with the Simpson Strong-Tie® Company name; product name (Titen HD®); type (Screw Anchor or Rod Hanger), anchor diameter and length; catalog number corresponding to Table 6 of this report; and the evaluation report number (ESR-2713). In addition, the symbol and the anchor length (in inches) are stamped on the head of each screw anchor.

7.2 The report holder’s contact information is as follows:

SIMPSON STRONG-TIE COMPANY INC.
5956 WEST LAS POSITAS BOULEVARD
PLEASANTON, CALIFORNIA 94588

 Anchor Data

| Yield Strength | f_y | psi | 100,000 | 97,000 | 100,000 | 97,000 |
| Tensile Strength | f_u | psi | 125,000 | 110,000 | 125,000 | 110,000 |
| Minimum Tensile & Shear Stress Area | A_u | in² | 0.042 | 0.099 | 0.183 | 0.276 | 0.414 | 0.042 | 0.099 | 0.099 |
| Axial Stiffness in Service Load Range - Uncracked Concrete | β_v | lb/in. | 202,000 | 672,000 | 202,000 | 672,000 |
| Axial Stiffness in Service Load Range - Cracked Concrete | β_c | lb/in. | 173,000 | 345,000 | 173,000 | 345,000 |

For SI: 1 inch = 25.4 mm, 1 ft-lbf = 1.356 N-m, 1 psi = 6.89 kPa, 1 in² = 645 mm², 1 lb/in = 0.175 N/mm.

1The information presented in this table is to be used in conjunction with the design criteria of ACI 318-14 Chapter 17 or ACI 318-11 Appendix D, as applicable.

2The clearance must comply with applicable code requirements for the connected element.

3The TITEN HD® Rod Hanger version is driven directly to the supporting member surface.

4Inst,max applies to installations using a calibrated torque wrench.

5For the 2006 IBC d_e replaces d_l.

6A_min = A_min = A_u.

For SI: 1 inch = 25.4mm, 1 lbf = 4.45N.

\(^1\)The information presented in this table is to be used in conjunction with the design criteria of ACI 318-14 Chapter 17 or ACI 318-11 Appendix D, as applicable.

\(^2\)The tabulated value of \( \phi_{aa} \) applies when the load combinations of Section 1605.2 of the IBC, ACI 318-14 Section 5.3 or ACI 318-11 Section 9.2, as applicable, are used. If the load combinations of ACI 318 Appendix C are used, the appropriate value of \( \phi \) must be determined in accordance with ACI 318 D.4.4(b).

\(^3\)The tabulated values of \( \phi_{cb} \) and \( \phi_{ap} \) apply when both the load combinations of Section 1605.2 of the IBC ACI 318-14 Section 5.3 or ACI 318-11 Section 9.2 are used and the requirements of ACI 318-11 D.4.4(c) for Condition B are met. Condition B applies were supplementary reinforcement is not provided in concrete. For installations where complying reinforcement can be verified, the \( \phi_{cb} \) and \( \phi_{ap} \) factors described in ACI 318-14 17.3.3(c) or ACI 318-11 D.4.3(c), as applicable, can be used for Condition A. If the load combinations of ACI 318 Appendix C are used, the appropriate value of \( \phi_{cb} \) must be determined in accordance with ACI 318 D.4.5(c) for Condition B.

\(^4\)The notation in parenthesis is for the 2006 IBC.

1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that the TITEN HD Screw Anchor and TITEN HD Rod Hanger for cracked and uncracked concrete, described in ICC-ES evaluation report ESR-2713, have also been evaluated for compliance with the codes noted below as adopted by the Los Angeles Department of Building and Safety (LADBS).

Applicable code editions:
- 2020 City of Los Angeles Building Code (LABC)
- 2020 City of Los Angeles Residential Code (LARC)

2.0 CONCLUSIONS

The TITEN HD Screw Anchor and TITEN HD Rod Hanger for cracked and uncracked concrete, described in Sections 2.0 through 7.0 of the evaluation report ESR-2713, comply with the LABC Chapter 19, and the LARC, and are subject to the conditions of use described in this supplement.

3.0 CONDITIONS OF USE

The TITEN HD Screw Anchor and TITEN HD Rod Hanger for cracked and uncracked concrete described in this evaluation report supplement must comply with all of the following conditions:

- All applicable sections in the evaluation report ESR-2713.
- The design, installation, conditions of use and identification of the anchors are in accordance with the 2018 International Building Code® (2018 IBC) provisions noted in the evaluation report ESR-2713.
- The design, installation and inspection are in accordance with additional requirements of LABC Chapters 16 and 17 as applicable.
- Under the LARC, an engineered design in accordance with LARC Section R301.1.3 must be submitted.
- The allowable strength and design strength values listed in the evaluation report and tables are for the connection of the anchors to the concrete. The connection between the anchors and the connected members shall be checked for capacity (which may govern).
- For use in wall anchorage assemblies to flexible diaphragm applications, anchors shall be designed per the requirements of City of Los Angeles Information Bulletin P/BC 2017-071.

This supplement expires concurrently with the evaluation report, reissued September 2019 and revised January 2020.
