Section: 06 05 23—Wood, Plastic, and Composite Fastenings

REPORT HOLDER:
JAACO CORPORATION

EVALUATION SUBJECT:
POWER-ACTUATED FASTENERS FOR DIAPHRAGM ASSEMBLIES WITH STEEL FRAMING AND WOOD STRUCTURAL PANELS

1.0 EVALUATION SCOPE
Compliance with the following codes:

Property evaluated:
Structural

2.0 USES
Jaaco NailPro hardened ballistic fasteners are used to attach oriented strand board (OSB) wood structural panels to cold-formed steel (CFS) framing for site-built horizontal diaphragm applications under the IBC to resist in-plane wind or seismic forces; and are limited to locations not exposed to the weather or damp environment. The fasteners may be used in structures regulated by the IRC, when an engineered design is submitted in accordance with IRC Section R301.1.3.

3.0 DESCRIPTION

3.1 Jaaco NailPro Hardened Ballistic Fasteners:

3.1.1 General: The fasteners are nail-shaped with a flat head. The fasteners are manufactured from steel wires complying with ASTM A510, Grade 1060 (UNS 10600), and are heat-treated to provide case and core hardness of 52 to 55 HRC. The fasteners have either electrodeposited zinc coatings with chromate finish or mechanically deposited zinc coatings complying, respectively, with ASTM B 633, Type II, SC 1, or ASTM B 695, Type 1 Class 12. The fasteners have a ballistic point with either a knurled or smooth shank, and are available loose in bulk containers; bundled in wire and plastic sheet coils; and collated in strips. Figure 1 shows the typical fasteners with knurled and smooth shank, and fastener head marking.

3.1.2 Knurled Shank Fasteners: The knurled shank fasteners (item number NP100K) have a nominal knurled shank diameter of 0.100 inch (2.69 mm), a nominal head diameter of 0.245 inch (6.20 mm), and a minimum length of 1 1/2 inches (38 mm).

3.1.3 Smooth Shank Fasteners: The smooth shank fasteners (item number NP145S) have a nominal smooth shank diameter of 0.145 inch (3.66 mm), a nominal head diameter of 0.300 inch (7.60 mm), and a minimum length of 1 1/2 inches (38 mm).

3.2 Wood Structural Panels (OSB):
Wood structural panels must be Structural 1, Exposure 1, OSB panels complying with DOC PS-2. The required span rating and nominal thickness of the rated OSB sheathing panels are given in Table 2.

3.3 Cold-formed Steel (CFS) Framing Members:
CFS framing members must be recognized in a current ICC-ES evaluation report and must be manufactured from steel complying with ASTM A 1003, ST Grade 50, Type H, or ASTM A 653 SS, Grade 50, Class 1, with a minimum coating designation of G60.

CFS diaphragm joists and blocking members must be members with a designation thickness of 68 mils (1.73 mm) [a minimum 0.0677-inch (1.72 mm) uncoated base-steel thickness], a minimum flange width of 1 5/8 inches (41.3 mm), a minimum depth of 3 5/8 inches (92.1 mm), and a minimum flange stiffener (lip) length of 1/2 inch (12.7 mm).

CFS diaphragm perimeter framing members must be members with a designation thickness of 68 mils (1.73 mm) [a minimum 0.0677-inch (1.72 mm) uncoated base-steel thickness], a minimum flange width of 1 1/2 inches (38 mm), and a minimum inside depth equal to the depth of the diaphragm joists.

4.0 DESIGN AND INSTALLATION

4.1 Design:

4.1.1 Single Fastener Connections: Allowable pullout and lateral loads for single fastener connections of OSB panels to CFS framing members are given in Table 1. The allowable lateral loads have been determined using a fastener-to-panel edge distance of 1/2 inch (12.7 mm) with loads parallel to the panel edge. Allowable loads in Table 1 are provided for comparison with other types of fasteners,
such as tapping screws, and are not recognized for use in
determining allowable loads for diaphragms

4.1.2 Horizontal Diaphragms: The maximum diaphragm
aspect ratio (span-to-width ratio) is 2 1/2:1. The OSB panels
must be installed with the long dimension perpendicular to
CFS joist framing and must be attached to the framing with
the NaiPro NP14SS fasteners at the spacings noted in
Table 2. Blocking may be used at the panel edge joints.
Allowable shear loads for wind or seismic forces are given
in Table 2. OSB panels must be capable of supporting
vertical loads based on the panel span rating as indicated
in Table 2. Diaphragm blocking may be required. If
diaphragm blocking is required, it must be installed in
accordance with the applicable code.

The deflection of a blocked OSB panel diaphragm
uniformly fastened throughout must be calculated using the
following equation, as applicable:

\[ \delta = \frac{5vL^3}{8E_sA_c b} + \omega_1 \frac{vL}{\rho G_{panel}} + \omega_2 \frac{s/4 \omega_1}{\rho \omega_2} (\frac{v}{144P})^2 + \frac{\sum_{i=1}^{n} \Delta_i X_i}{2b} \]

For SI:

\[ \delta = 0.052vL^3 + \omega_1 \frac{vL}{\rho \omega_1} + \omega_2 \frac{s/4 \omega_1}{\rho \omega_2} (\frac{v}{0.00405})^2 + \frac{\sum_{i=1}^{n} \Delta_i X_i}{2b} \]

where:

- \( A_c \) = Gross cross-sectional area of chord member, in square inches (mm²)
- \( b \) = Diaphragm depth parallel to direction of load, in feet (mm)
- \( E_s \) = Modulus of elasticity of steel = 29,500,000 psi (203,000 MPa)
- \( G_{panel} \) = OSB panel sheathing rigidity through the
  thickness = 83,500 lbf/in. of panel depth. See Table 2305.2 (2) of the IBC.
- \( L \) = Diaphragm length perpendicular to direction of load, in feet (mm)
- \( n \) = Number of splices in both diaphragm chords
- \( s \) = Maximum fastener spacing at panel edge, in inches (mm)
- \( l_{panel} \) = Nominal panel thickness, in inches (mm)
- \( t_{joist} \) = Nominal framing thickness, in inches (mm)
- \( v \) = Shear demand (V/2b), in pounds per linear foot
  (N/mm)
- \( V \) = Total lateral load applied to the diaphragm, in
  pounds (N)
- \( X_i \) = Distance between the “ith” chord-splice and the
  nearest support (braced wall line), in feet (mm)
- \( \alpha \) = Ratio of the average load per fastener based
  on a non-uniform fastener pattern to the
  average load per fastener based on a uniform
  fastener pattern (= 1 for a uniformly fastened
  diaphragm)
- \( \beta \) = 660 for OSB
- \( \Delta_i \) = Deformation value associated with “ith” chord
  splice, in inches (mm)
- \( \rho \) = 1.05 for OSB
- \( \omega_1 \) = s/6 (for s in inches), s/152.4 (for s in mm)
- \( \omega_2 \) = 0.033/t_{joist} (for t_{joist} in inch) and 0.838/t_{joist}
  (for t_{joist} in mm)

For an unblocked OSB panel diaphragm, \( \delta \) must be
multiplied by 2.5.

4.2 Installation:

The NaiPro hardened ballistic fasteners must be
installed using pneumatic or fuel-powered tools
recommended by NaiPro Corporation. The fasteners
must be such that the fasteners’ tips pierce the OSB
panels being fastened and protrude through the CFS
framing members a minimum of 1/2 inch (12.7 mm). The
fasteners must be installed a minimum of 6 inches (152 mm)
on center in the field of the sheathing panel. The spacing
of the fasteners at the panel edges must be a minimum of
2 inches (51 mm) and a maximum of 6 inches (152 mm), as
specified by a registered design professional, based on
Table 2.

The CFS diaphragm joists must be fastened to the
diaphragm tracks, with one No. 10 by 3/4-inch-long
(19.1 mm), modified truss head, zinc-coated screws
complying with ASTM C1513, through each flange.

5.0 CONDITIONS OF USE

The Jaaco NailPro hardened ballistic fasteners described
in this report comply with, or are suitable alternatives to
what is specified in, those codes listed in Section 1.0 of
this report, subject to the following conditions:

5.1 The fasteners must be installed in accordance with
the manufacturer’s installation instructions and this
report. In the event of a conflict between this report
and the manufacturer’s installation instructions, the
more restrictive requirements govern.

5.2 Calculations demonstrating that the applied in-plane
shear loads are less than the available diaphragm
strength must be submitted to the code official for
approval. The calculations must be prepared by a
registered design professional where required by the
statutes of the jurisdiction in which the project is
constructed.

5.3 Use of the fasteners described in this report is limited
to dry, interior locations.

5.4 Use of the fasteners described in this report in contact
with preservative-treated or fire-retardant-treated
wood members is outside scope of this report.

5.5 An approved exterior roof covering must be installed
over the wood structural panels when the panels are
considered to be a weather-exposed roof surface, as
defined by the applicable code.

5.6 The fasteners are manufactured under a quality
control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria
for Horizontal Diaphragms Consisting of Wood Structural
Panel Sheathing Attached to Cold-formed Steel Framing
(AC262), dated June 2016 (editorially revised November
2017).

7.0 IDENTIFICATION

7.1 Each carton and packaging unit of the hardened
ballistic fasteners described in this report must be
identified by a label bearing the name and address of the report holder (Jaaco Corporation); the product brand name (NailPro) and item number; nominal fastener size and length; coating type; and the ICC-ES evaluation report number (ESR-2961). Each fastener head must bear a marking as shown in Figure 1.

7.2 The report holder’s contact information is the following:

</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 lbf = 4.45 N.

1The tabulated values are for short-term loading due to wind or seismic forces. For shear loads of normal and permanent load duration as defined by the AWC NDS, the tabulated values must be multiplied by 0.75 and 0.67, respectively.
2The fasteners must be long enough to penetrate the steel framing members a minimum of 1/2 in. (12.7 mm).
3The minimum edge distance from a fastener to the panel edge must be 1/2 in. (12.7 mm).
4The tabulated values are for OSB panels described in Section 3.2. For OSB panels other than the OSB panels described in Section 3.2, covered in DOC PS-2, reduce loads by 10 percent.
5Lateral strength of fastener connections are for general attachment of sheathing to CFS framing and must not be used to determine diaphragm capacities.

For SI: 1 inch = 25.4 mm, 1 lb/ft = 14.6 N/m.

1The tabulated values are for short-duration loads due to wind and seismic forces. For shear loads of normal and permanent load duration as defined by the AWC NDS, the tabulated values must be multiplied by 0.75 and 0.67, respectively.
2The fasteners must be long enough to penetrate through the steel framing a minimum of 1/2 in. (12.7 mm).
3Wood structural panels must be installed with the long dimension perpendicular to steel joist framing. Blocking may be used at the panel edge joints. The minimum edge distance from the fastener to the wood structural panel edge must be 1/2 in. (12.7 mm). Fastener spacing must be 6 in. (152 mm) on center in the field of the wood structural panels.
4Framing is permitted to be oriented in either direction for diaphragms, provided sheathing is designed for vertical loads.
5Thicker OSB wood structural panels may be used, but provide no increase in allowable shear loads. The fastener penetration must comply with Footnote 2.
